

# Nudge

*Personalized Patient Data and Behavioral Nudges to Improve Adherence to Chronic Cardiovascular Medications*

- Patient-level randomized pragmatic trial comparing the effects of digital interventions (text messages and chat bot) on **medication adherence** in patients with chronic cardiovascular conditions
- 3 health systems

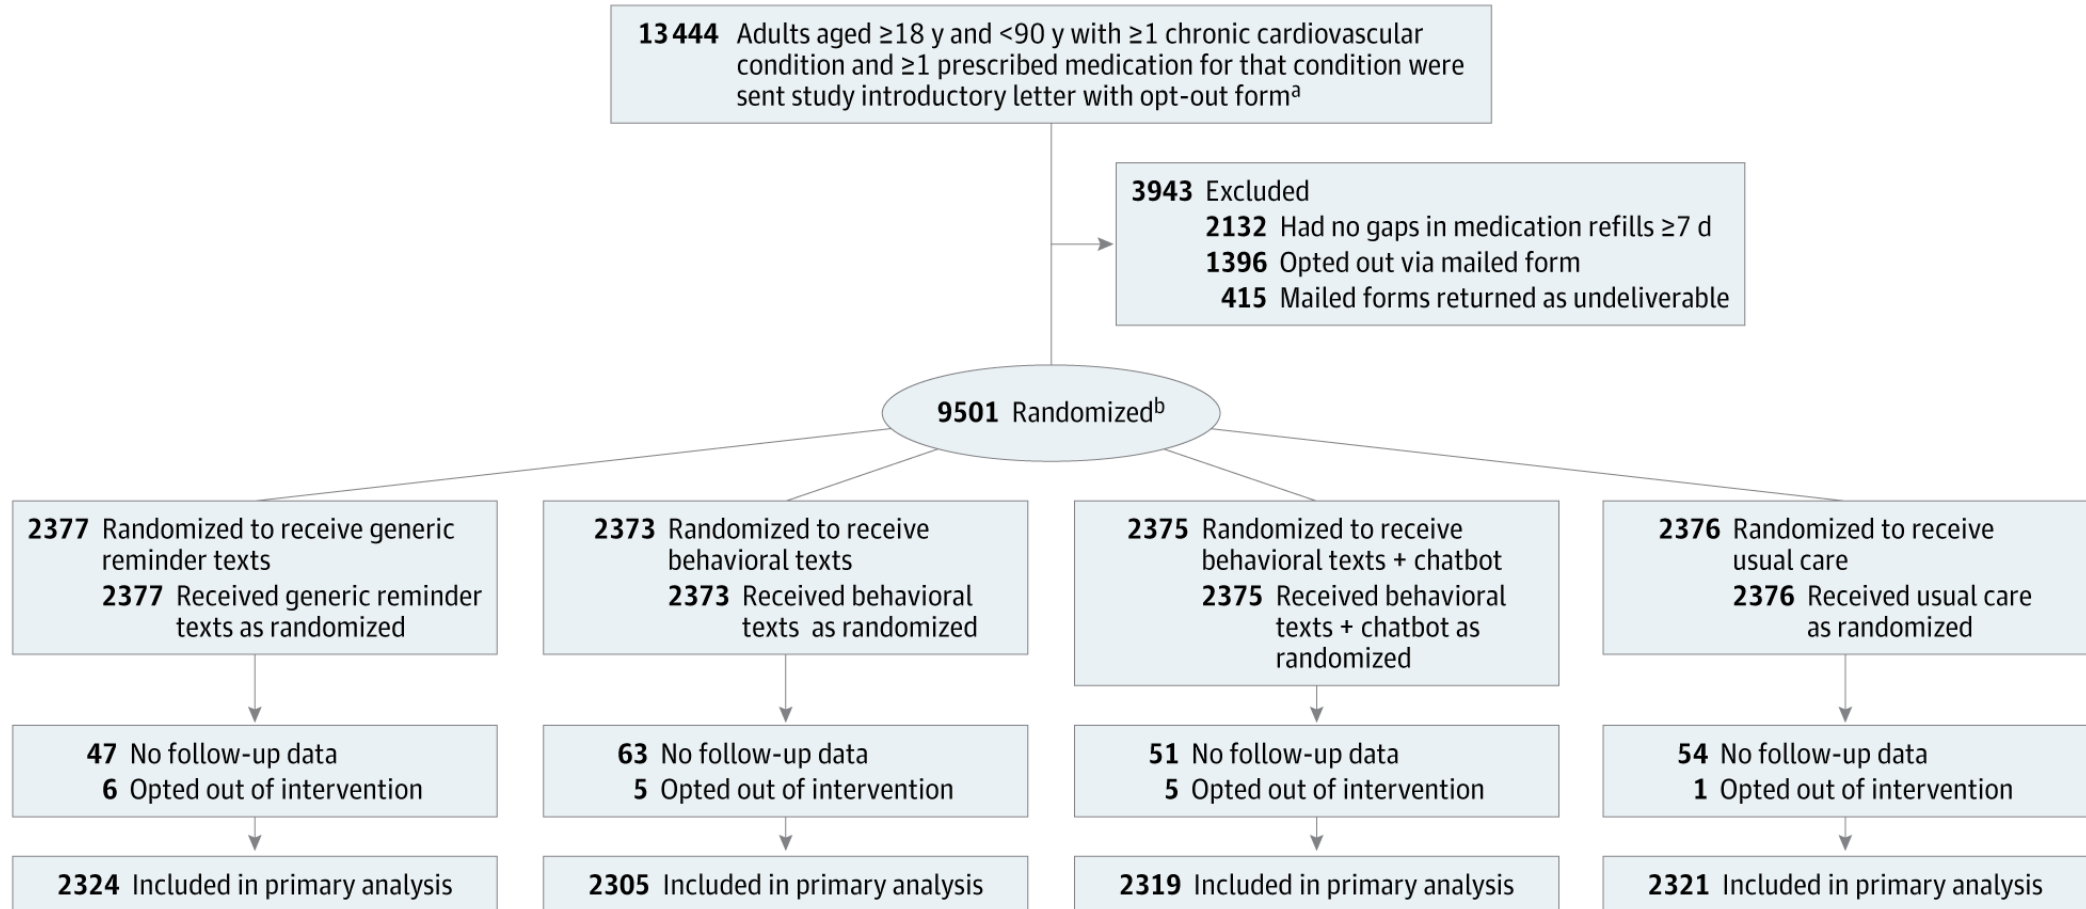

JAMA | **Original Investigation**

## Personalized Patient Data and Behavioral Nudges to Improve Adherence to Chronic Cardiovascular Medications A Randomized Pragmatic Trial

# MAIN STUDY FINDINGS

Monthly proportion days covered stratified by treatment group

Adjusted difference in proportion days covered from Usual Care stratified by follow-up month

Primary Outcome: PDC at 12-months

## From: Personalized Patient Data and Behavioral Nudges to Improve Adherence to Chronic Cardiovascular Medications: A Randomized Pragmatic Trial

**Table 2. Differences in Mean Proportion of Days Covered From Usual Care**

| Primary analysis outcome | Unadjusted proportion of days covered, % <sup>a</sup> |                                  |  |                       | Adjusted absolute difference (from usual care) in percentage points of the proportion of days covered <sup>b</sup> |                    |                       |                    |                                 |                    |
|--------------------------|---|----------------------------------|--|-----------------------|--|--------------------|-----------------------|--------------------|---------------------------------|--------------------|
|                          | Generic reminder text (n = 2324)                      | Behavioral nudge text (n = 2305) | Behavioral nudge text + chatbot (n = 2319) | Usual care (n = 2321) | Generic reminder text  |                    | Behavioral nudge text |                    | Behavioral nudge text + chatbot |                    |
|                          |   |                                  |  |                       | Difference (95% CI)  | P value            | Difference (95% CI)   | P value            | Difference (95% CI)             | P value            |
| 3 Mo                     | 61.4  | 61.1                             | 61.6                                       | 56.2                  | 5.6 (3.4-7.8)  | <.001 <sup>c</sup> | 4.8 (2.5-7.0)         | <.001 <sup>c</sup> | 5.2 (3.0-7.4)                   | <.001 <sup>c</sup> |
| 12 Mo                    | 62.0  | 62.3                             | 63.0                                       | 60.6                  | 2.2 (0.3-4.2)  | .02                | 2.0 (0.1-3.9)         | .04                | 2.3 (0.4-4.2)                   | .02                |

<sup>a</sup> Days covered were defined as days that patients were taking any of the study medications at baseline. Patients active taking multiple study medications had all combinations of follow-up days for all baseline medications counted in the denominator and days that medications were filled counted in the numerator.

<sup>b</sup> Analyses adjusted for health care system, number of medications gapping at baseline, treatment group, follow-up month, patient demographics including age, gender, race, ethnicity, insurance status, marital status as

well as comorbidity variables including hypertension, hyperlipidemia, coronary artery disease, diabetes, atrial fibrillation, chronic heart failure, chronic kidney disease, cerebrovascular disease, prior myocardial infarction, prior revascularization, depression, posttraumatic stress disorder, and substance abuse.

<sup>c</sup> Indicates significant result with adjusted level of significance (.05/3).

**Table 3. Mean Difference in Median Gap Lengths in Days From Usual Care**

| Secondary analysis                 | Gap length, median (IQR), d      |                                  |  |                       | Mean difference (from usual care) in medians |                    |                       |                    |                                 |                    |
|------------------------------------|----------------------------------|----------------------------------|--|-----------------------|--|--------------------|-----------------------|--------------------|---------------------------------|--------------------|
|                                    | Generic reminder text (n = 2324) | Behavioral nudge text (n = 2305) | Behavioral nudge text + chatbot (n = 2319) | Usual care (n = 2321) | Generic reminder text                        |                    | Behavioral nudge text |                    | Behavioral nudge text + chatbot |                    |
|                                    |                                  |                                  |  |                       | Difference (95% CI)                          | P value            | Difference (95% CI)   | P value            | Difference (95% CI)             | P value            |
| Initial gap <sup>a</sup>           | 9 (1-55)                         | 9 (1-62)                         | 10 (1-59)                                  | 15 (1-85)             | 5 (3-7)                                      | <.001 <sup>b</sup> | 5 (3-7)               | <.001 <sup>b</sup> | 5 (3-7)                         | <.001 <sup>b</sup> |
| All subsequent gap(s) <sup>c</sup> | 16 (6-56)                        | 17 (6-59)                        | 15 (6-56)                                  | 20 (8-58)             | 4 (1-6)                                      | .01 <sup>b</sup>   | 3 (0-6)               | .06                | 4 (2-7)                         | .01 <sup>b</sup>   |

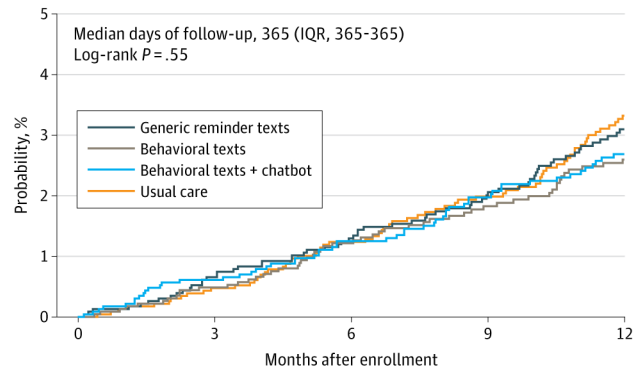

<sup>b</sup> Indicates significant result with adjusted level of significance (.05/3).

<sup>c</sup> All gaps following the initial enrollment gap were tracked individually and assessed time from the start of the gap to a fill. Subsequent gaps exclude the initial gap.

| Behavioral texts           | 2305 | 2147 | 1914 | 1618 | 1551 |
| Behavioral texts + chatbot | 2319 | 2147 | 1908 | 1626 | 1546 |
| Usual care                 | 2321 | 2184 | 1946 | 1657 | 1576 |

**C** Emergency department visits

| No. of patients            | 0    | 3    | 6    | 9    | 12   |
|----------------------------|------|------|------|------|------|
| Generic reminder texts     | 2324 | 2023 | 1717 | 1405 | 1281 |
| Behavioral texts           | 2305 | 2031 | 1736 | 1400 | 1287 |
| Behavioral texts + chatbot | 2319 | 2007 | 1696 | 1380 | 1262 |
| Usual care                 | 2321 | 2053 | 1735 | 1412 | 1279 |

### Kaplan-Meier Rates for Secondary Clinical Outcomes Stratified by Treatment Group

# CONCLUSIONS

- At 12 months, text message reminders did not improve medication refill adherence
- At 3 months, refill adherence was 5% higher and median length of gaps was shorter by 5 days for all intervention groups compared with usual care (post hoc analysis)
- Limitations
  - Engagement with text messages not known
  - Potential incomplete capture of pharmacy refill data
  - Text messaging system not integrated with healthcare system pharmacy
  - Primary outcome not sensitive to intervention

# Lessons Learned

- Opt-out enrollment is feasible and drop out rates lower than expected
  - Enrolled patients historically underrepresented in clinical trials
- Patients generally satisfied with text messages
  - Preferred positive messages; disliked humor and emojis
- Clinical burden for pharmacists were low
  - Questions mainly related to refill logistics and costs
- Making primary outcome more proximal to the intervention delivery
- Patient engagement in the intervention is a challenge and any engagement was associated with improved adherence
- Text messages interventions can be a low cost intervention among a suite of interventions to improve medication adherence
- Health system integration is a challenge but likely to be beneficial

# Considerations

- Rapid advances in technology; how to take advantage of these advances in light of the time lag between grant submission to funding?
- How much flexibility to modify/adapt intervention/outcome following UG3 pilot and prior to UH3 launch?

# Future of Medication Adherence Research

- Leverage EHR and other data for more personalized interventions
  - Timing/type/intensity of intervention needs to be flexible and adaptable depending on patient context
  - Multi-modal interventions better
  - Just-in-time interventions
- Layered approach to adherence interventions from population wide to more specific patient populations
- Integration of interventions within the EHR
- Integration of interventions within health system infrastructure (e.g., clinical support when needed)
