Talk Outline

- Brief review of study goals/design
- Challenges
 - -Intervention implementation
 - -Outcome measurement from EHR

Disc Degeneration in Asx

Primary Hypothesis

 For patients referred from primary care, inserting prevalence benchmark data in lumbar spine imaging reports will reduce overall spine-related healthcare utilization as measured by spine-related relative value units (RVUs)

Intervention Text

The following findings are so common in normal, pain-free volunteers, that while we report their presence, they must be interpreted with caution and in the context of the clinical situation. Among people between the age of 40 and 60 years, who do <u>not</u> have back pain, a plain film x-ray will find that about:

- 8 in 10 have disk degeneration
- 6 in 10 have disk height loss

Note that even 3 in 10 means that the finding is quite common in people without back pain.

Intervention Implementation Challenges

- Technical
- Cultural

Implementation Challenges- Technical: Different Deployment by Health Systems

- Radiology Information System (RIS) (during dictation) vs. EHR (after dictation)
- Different EHRs required different modes of insertion (dynamic pop-ups vs. static)
 - Pop-ups had potential to interfere with temporal randomization
- "Upgrade" of RIS broke implementation

Technical Challenge Solutions

- Pilot at all health care systems working closely with site programmers who best know the systems
- Monitor implementation at regular intervals to check for breakage

Implementation Challenges- Cultural

- Some of radiologists at one health system against intervention
- Some radiologists wanted to be able to remove it when they thought that it wasn't clinically relevant

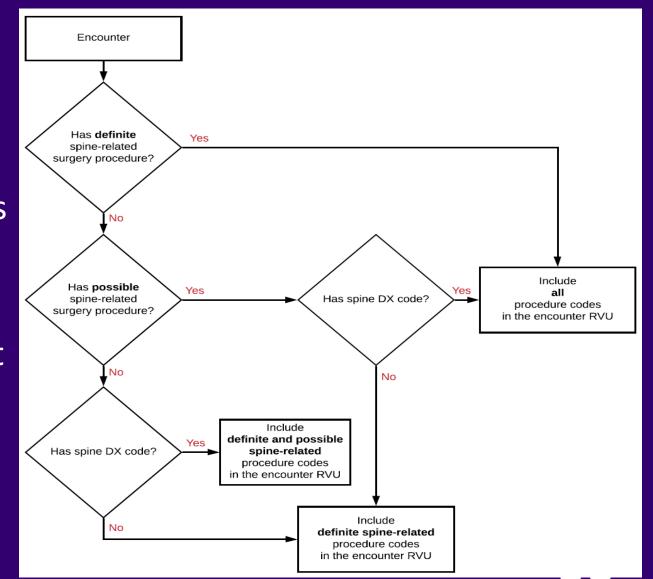

Cultural Implementation Solutions

- Worked closely with health system leadership to gain their buy-in
- Site PI with site leadership able to convince site docs to cooperate

Outcome Measurement Challenge: Spine-related RVU

- Diagnosis codes
 - ICD-9
 - ICD-10
- Procedure codes
 - CPT
 - ICD 9/10
- Need to account for annual changes in codes

Outcome Measurement Challenge: Decoding the Codes

- People assigning the codes at health systems make decisions/judgements
- Practices vary regarding what is coded how
 - Specificity may vary- # of levels may not be included
 - Approach (anterior vs. posterior vs. combined) may not be specified
 - -Sometimes used CPT vs. ICD-PC vs both

Some Key Lessons Learned

- Keep intervention as simple as possible
- Keep outcomes as simple as possible
- Minimize burden on system partners
- Understanding complexities of EHR coding is iterative process that takes time

Key People

- Katie James, PA, MPH, Director
- Brian Bresnahan, PhD- Health Econ
- Bryan Comstock, MS- Biostats
- Janna Friedly, MD- Rehab
- Laurie Gold, PhD- Radiology
- Patrick Heagerty, PhD- Biostats
- Larry Kessler, PhD- HSR
- Danielle Lavallee, Pharm D, PhD
- Eric Meier, MS- Biostats
- Nancy Organ, BA- Statistics
- Kari Stephens, PhD- Informatics

- Dave Nerenz, PhD- HFHS
- Dave Kallmes, MD- Mayo
- Patrick Luetmer, MD- Mayo
- Andy Avins, MD, MPH- KPNC

Collecting and Sharing Patient Reported Outcomes (PROs) in Pragmatic Trials: Lessons learned from the PPACT trial

Lynn DeBar, PhD, MPH Kaiser Permanente Washington Health Research Institute Seattle, Washington

Supported by NIH Common Fund and by NINDS through cooperative agreement (with NIDA scientific advisory support) (UH3NW0088731)

DeBar et al, Contemporary Clinical Trials, 2018; DeBar et al, Translational Behavioral Medicine, 2012

PPACT Overview

- AIM: Integrate interdisciplinary services into primary care to help patients adopt self-management skills to:
 - Manage chronic pain (decrease pain severity / improve functioning)
 - Limit use of opioid medication
 - Identify exacerbating factors amenable to treatment

Focus on feasibility and sustainability

DESIGN: Cluster (PCP)-randomized PCT (106 clusters, 273 PCPs, 851 patients)

ELIGIBILITY: Chronic pain, long-term opioid tx (prioritizing ≥ 120 MED, benzodiazepine co-use, high utilizers [≥ 12 visits in 3 months])

INTERVENTION: Behavioral specialist, nurse case manager, PT, and pharmacist team; 12 week core CBT + adapted movement groups

OUTCOMES: Pain (3-item PEG), opioid MED, pain-related health services, and cost

What does it take to collect PRO data in routine clinical care?

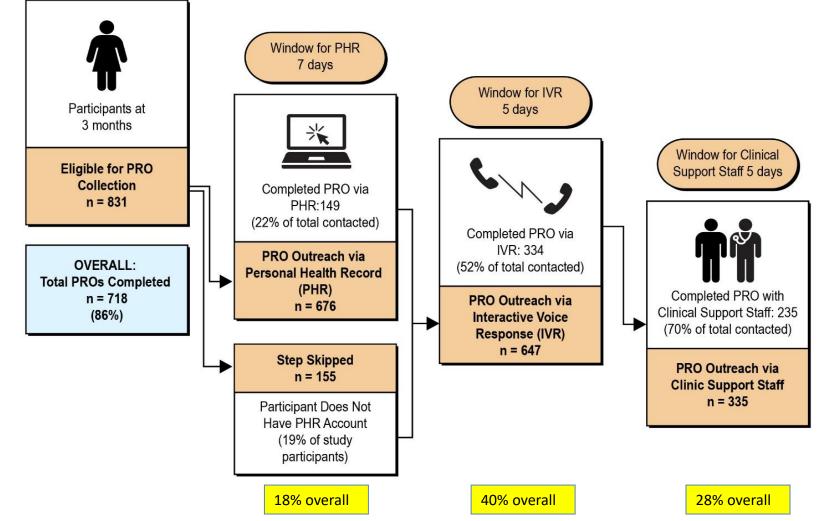

- Opioid therapy plans required for all patients on long-term opioids and included "regular" BPI administration
- 12-item BPI resisted by clinicians (too long, focused on pain intensity)
- Shifted national KP EHR-embedded standard to PEG(S) (Pain, Enjoyment of Life, General Activity, Sleep)

Panel Support Tool – it takes more than EPIC to prompt administration

What it might <u>really</u> takes to collect PRO data in routine clinical care

Owen-Smith et al, Journal of General Internal Medicine, 2018

There is no obvious best way to communicate with PCPs about individual patients within the EMR

- EMR-based PPACT pre/post summaries not as effective as hoped
- PCP workload/workflow attentional constraints
- Emailing/messaging providers about specific actionable concerns works well, but does not provide the "big picture" required for co-management

"Unless we were specifically alerted to look in this place... there's way too much noise in the chart" – PCP, about reviewing a PPACT report

Enhancing PRO use in routine clinical care: Lessons learned

- "Pulling" PROs from EHR (data availability / quality)
 - Most PRO adoption "stick" rather than "carrot" driven
 - EHR IT enhancements (pop mgmt) critical for routine PRO collection
 - Frequency and amount of "routinely" collected PRO data often confounded with patient's clinical severity

- "Pushing" PROs into EHR (enhancing clinical utility)
 - Multimodality support for enhanced collection may be needed
 - PRO EHR display may limit clinical utility (esp for complex conditions)
 - HCS technology often lags, untethered systems may be most feasible

SHOULD WE UNCOUPLE [some types of] PRO DATA COLLECTION FROM ROUTINE CLINICAL CARE?

Using EHR Innovation to Enhance Pragmatic Trial Follow-up Approaches for Trauma Care Systems

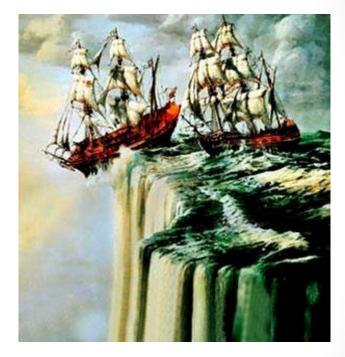

Douglas Zatzick, MD Principal Investigator Trauma Survivors Outcomes & Support (TSOS) Study Professor Department of Psychiatry Harborview Level I Trauma Center University of Washington School of Medicine Seattle

Funded by Grant UH3 MH106338

Trauma Center Care Transitions

- Patients "sail off of a flat earth" after trauma center care
- Transition across multiple service delivery sectors
- Paucity of "routine" follow-up

• NIH Collaboratory Rethinking Clinical Trials®

Health Care Systems Research Collaboratory

From NIH Collaboratory ePCT Training: Choosing Endpoints in PCTS (Richesson & Curtis 2/18)

- More pragmatic endpoints...
 - Matter to providers and patients
 - Are captured reliably as part of routine clinical care
 - Do not require central adjudication
 - Are shorter-term in nature

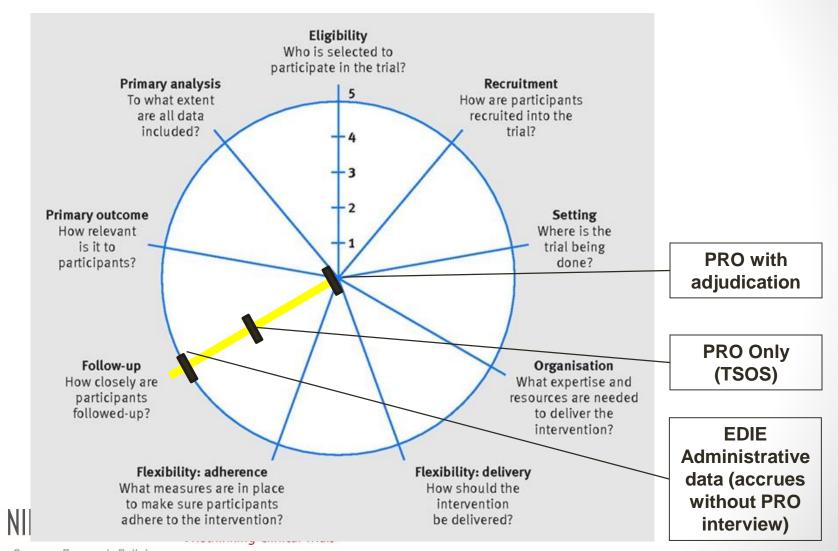

From NIH Collaboratory ePCT Training: Choosing Endpoints in PCTS (Richesson & Curtis 2/18)

- More pragmatic endpoints...
 - Matter to providers and patients
 - Are captured reliably as part of routine clinical care
 - Do not require central adjudication
 - Are shorter-term in nature

Choosing an endpoint that is not captured reliably as part of routine clinical care or impedes the clinical workflow is not pragmatic!

Implementing PROVEN

PRagmatic Trial of Video Education in Nursing Homes

Susan L. Mitchell, MD, MPH Vincent Mor, PhD Angelo Volandes, MD, MPH

UH3AG049619

Grand Rounds: Advances at the Intersection of Digital Health, Electronic Health Records and Pragmatic Clinical Trials: Experiences from the Collaboratory PCTs

Friday, May 29, 2020 — 1-2 p.m. Eastern Time

BROWN School of Public Health

PROVEN: Objective

 To conduct a pragmatic cluster RCT of an Advance Care Planning video intervention in NH patients with advanced comorbid conditions in two NH healthcare systems

Background: Nursing Homes

- NHs are complex health care systems
 - 3 million patients admitted annually
 - Rapidly growing % post-acute care
- Patients medically complex with advanced comorbid illness
- NHs charged with guiding patient decisions by default

Background: ACP

- Advance care planning (ACP)
 - *Process* of communication
 - Align care with preferences
 - Leads to advance directives (e.g., DNR, DNH)
- Better ACP associated with improved outcomes
- ACP suboptimal in NHs
 - Not standardized
 - Low advance directive completion rates
 - Not reimbursed
 - Regional and racial/ethnic disparities

PROVEN: Intervention NHs

- 18 month intervention period
- Suite of 5 ACP videos
 - Goals of Care, Advanced Dementia, Hospitalization, Hospice, ACP for Healthy Patients
- Offered facility-wide
 - All new admits, care-planning meetings for longstay, readmission
- Flexible (who, how, which video)
- Tablet devices, internet via URL and password
- Training: corporate level, webinars, toolkit

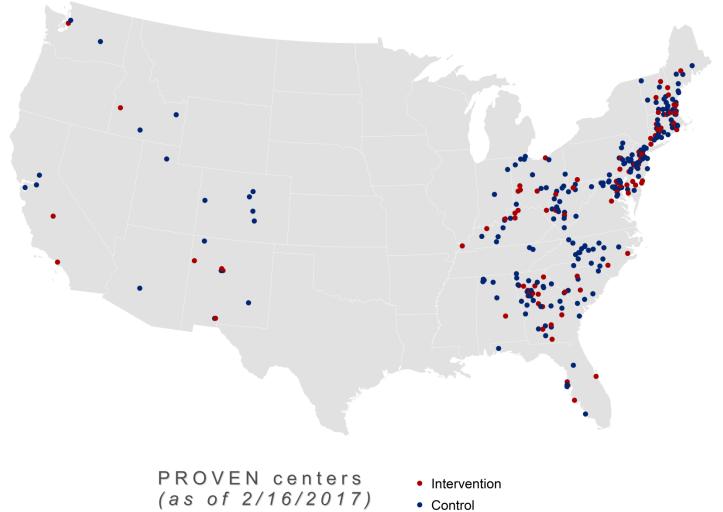

PROVEN: Control NHs

- Usual ACP practices
- Recognize programs may be going on in background (i.e., *INTERACT*)

Distribution of PROVEN NHs

PROVEN: Primary Outcome

 Primary Outcome Target Cohort: Number of hospitalizations/person-days alive among patients >=65 years old who are in a NH >=90 days ("long-stay") and who have <u>EITHER</u> advanced dementia or advanced congestive heart failure/chronic obstructive lung disease

Assuring Completeness of Primary Outcome Data

- Reasons for Incomplete Data
 - Nursing home residents are hospitalized and may not return to originating NHs
 - NHs may not know if their hospitalized patients die
 - NHs may transfer patients to another facility
- Solution: Match NH EMR to Medicare Claims using Virtual Research Data Center

Data infrastructure in PROVEN

These have been essential to implementing and monitoring PROVEN:

- 1. Integrated a Video Status Report (VSR) into the healthcare systems' EMRs to document delivery of the ACP Video Program
- 2. Data transfers between healthcare systems and Brown (Minimum Data Set, VSR, Physician orders)
- 3. Generated monthly compliance reports for the healthcare systems
- 4. Uploading data to the CMS Virtual Research Data Center (VRDC) to create finder files to match all Medicare claims, particularly hospitalization
- 5. Used CMS "Workbench" for immediate access to claims

Implications of Using CMS VRDC

- Medicare hospital claims available within one month; ED and Obs day claims w/in 2 months
- Last day of study followup 5/30/19; last EMR data update 6/30/19; Final analyses began 10/15/19
- BUT
- 25% 30% of patients are Medicare Advantage
- MA encounter data 4 years out of date; Hospital claims for MA 2 years late

Summary

- Health services and mortality outcomes for Medicare Beneficiaries readily accessible
- Rapidity of outcome ascertainment in large pragmatic trials is a "game changer"
- Cost and technical challenges complicate things
- BUT, running large cluster RCTs relying on EMR for case identification allows uploading of data for case matching on CMS with no losses
