 NIA R33AG057451 embedded Pragmatic Trial of Music & Memory in ADRD NH population

Purpose

- Summarize Evidence on the Effectiveness of nonpharmacologic interventions to ameliorate disturbed behavior among persons with Advanced Dementia
- Identify gaps in readiness to broadly disseminate "evidence based" interventions
- Present a framework to evaluate the readiness of an intervention for dissemination in health systems
- Provide Examples of intervention readiness
- Consider Implications for disseminating "evidence based" interventions in the "real world" of functioning health systems

Summary of Evidence Synthesis

Care-Delivery Interventions to Manage Agitation and Aggression in Dementia Nursing Home and Assisted Living Residents: A Systematic Review and Meta-analysis

Eric Jutkowitz, BA,*[†] Michelle Brasure, PhD, MSPH, MLIS,*^{†‡} Erika Fuchs, PhD, MPH,*^{†§} Tetyana Shippee, PhD,* Rosalie A. Kane, PhD,* Howard A. Fink, MD, MPH,^{†‡} Mary Butler, PhD,*[†] Tonye Sylvanus, MBBS,* and Robert L. Kane, MD*[†]

ADRD Interventions

Target	Outcomes	Method of Delivery	Example
Person with	Quality of life, behaviors, specific behaviors, function, physical activity	Directly to the person with ADRD	Physical exercise
ADRD		Through the care staff	Dementia care mapping
		Through family member	Case conferences /decision aids
		Through the environment	Functional modifications
		Through the care delivery	De-prescribing

interventions

system

Challenges

- Interventions for person with ADRD, care staff, family caregivers
- Multiple outcomes and measures

 Criteria to determine what is ready to be tested (NIH stage model)

Challenges

Settings poorly described

 Heterogeneous interventions hard to summarize with evidence-synthesis tools

Inconsistent terminology

Many One-off studies (little replication)

Methods

Search of systematic reviews

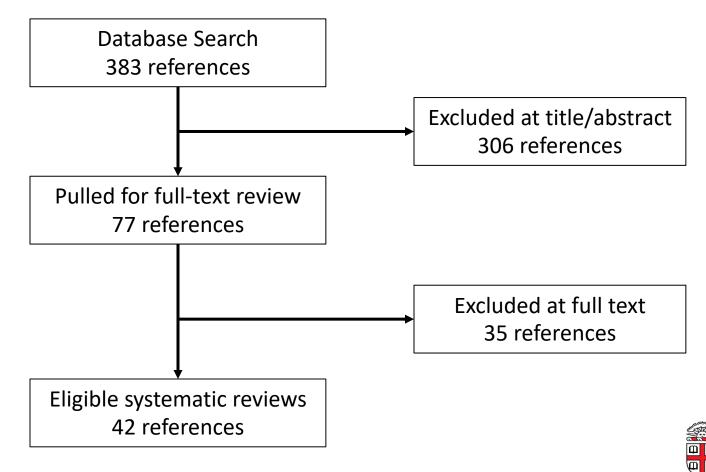

- Find signals
 - What interventions
 - What outcomes
 - What results

Methods

- Data sources: Medline, Cochrane, hand searches
- <u>Population</u>: individuals with dementia in facilities (nursing home, assisted living, other)
- Interventions: nonpharm interventions
- Outcomes: any outcomes in a person with dementia
- <u>Comparators</u>: usual care or no treatment, attention control or placebo, other nonpharm interventions, pharmacologic interventions

Included Studies

School of Public Health

Implementation Challenges Described

Complexity

Scalability

Long term fidelity/maintenance

Cost

Example: Dementia Care Mapping (DCM)

- Staff or trained experts systematically observe a person with dementia. Feedback is then provided to care staff who use the information to develop person centered care plans.
- Expert training, labor intensive, costly
- Scalable?

Dementia Care Mapping (DCM): Researcher vs. Provider Implementation

- Chenoweth 2009
 - Staff training in DCM followed by care mapping sessions by researchers and trained staff
 - Researchers implementing DCM "participated in hundreds of hours of intervention procedures"
 - Care plans implemented by staff with researcher input
- Van de Ven 2013
 - Two care staff trained in DCM, all staff provided with high-level briefing on DCM, two DCM cycles performed
- Rokstad 2013
 - Staff trained in DCM, care mapping by researchers and staff at beginning of study and at 6 months.
 - Care plans implemented by staff without researcher input
 Hartford Center for Gerontological Nursing
 Conference 2018

Dementia Care Mapping Results

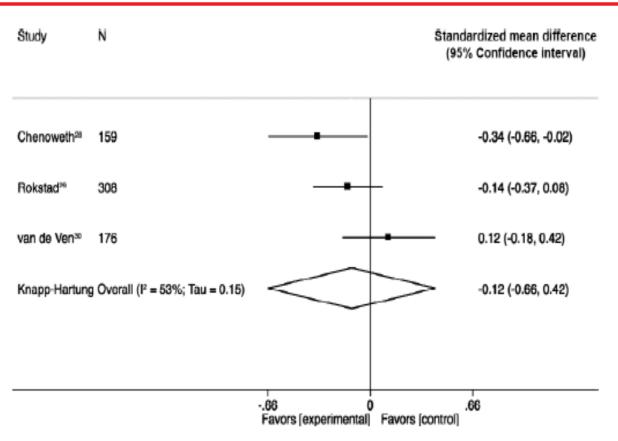

Figure 1. Random-effects meta-analysis for the effect of dementia care mapping on frequency of agitation and aggression. SMD = standardized mean difference; CI = confidence interval.

Translating Researchers' Interventions into Health Systems Programs

- Researcher Directed interventions done in NHs but separate from ongoing care systems
- Even careful training and monitoring of staff implemented interventions not like "usual care"
- Integrating new programs into existing care processes requires human re-engineering
- To really test whether "evidence based interventions" can be implemented, need Embedded Pragmatic Clinical Trial

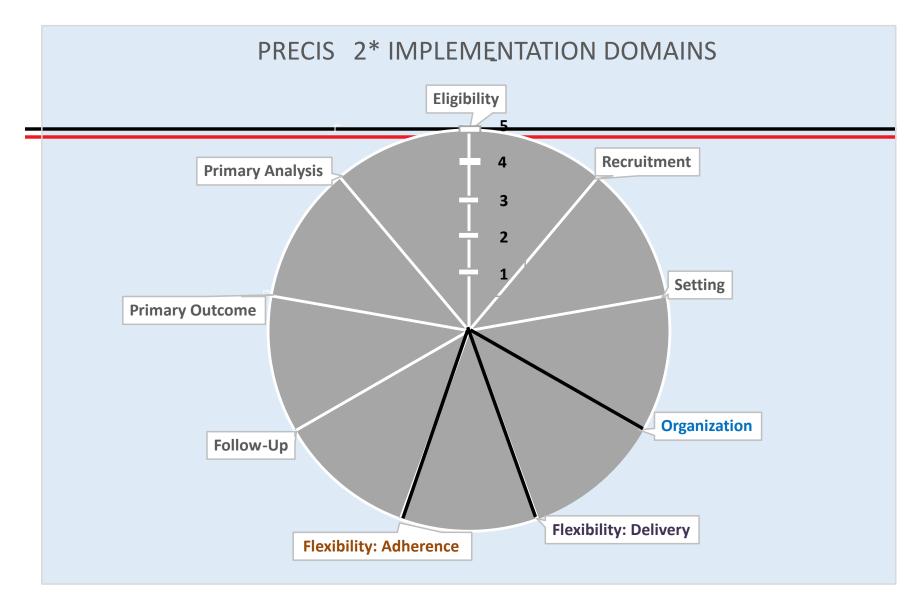

The Simpler the Intervention the Easier Conducting a Pragmatic Trial

- Easy: Substitute one vaccine for another (e.g. high dose influenza vs Standard dose)
- Surprisingly Complicated: PROVEN -- Video Assisted Advance Care Planning for ALL in NH
- Multi-pronged: Music & Memory
- Multi-pronged Complexity: INTERACT, DCM-Dementia Care Mapping, Staff Training

School of Public Health

How Pragmatic? How Replicable?

- PRagmatic Explanatory Continuum Indictor Summary (PRECIS)
- Refers to BOTH trial design AND implementation design and flexibility in the organization of the intervention
- PROVEN: Researchers trained Corporate Staff who trained facility staff and monitored intervention adherence
 - Changes required based on monitoring data

^{*} PRECIS-2 diagram from Loudon et al, BMJ, 2015 with adapted formatting.

Implementation RT vs. HCS: ORGANIZATION

ASPECT	Approach	Challenges
TRAINING	RT: Developed training materials -e.g., printed toolkit, webinars, laminated card HCS: Leveraged existing corporate infrastructures to do trainings RT & HCS: Co-led trainings	 HCS' had different preferred modalities: HCS1: Centralized, in-person HCS2: Multiple Webinars Turnover of NH champions required multiple re-trainings
PERSONNEL	HCS: Corporate-level leader appointed to oversee project; Site champion(s) at each NH	 Turnover of both corporate leaders Extensive champion turnover
RESOURCES	RT: Developed intervention; supplied tablets with videos HCS: Provided training venues; embedded video status report into EMR	Tablets stolen at one site so RT replaced them

^{*}RT=research team; HCS=health care system

Implementation: FLEXIBILITY (DELIVERY)

ASPECT	Approach	Challenges		
PROTOCOL- DRIVEN	RT: Guidelines for timing of video OFFERING proscribedRT: Flexible guidelines for: -which videos to offer which patient -who shows videos (mostly SW)	 Higher adherence for admissions vs. LTC Competing responsibilities a barrier LTC-patients hard to find "right time", family often not at care planning meeting 		
CO- INTERVEN- TIONS	HCS: Allowed other ongoing ACP activities to continue in NHs	 Other ACP programs highly variable Many other initiatives to ↓hospitalizations (1° outcome) 		
MONITOR- ING	RT: Designed Video Status Report (VSR) HCS: Embeds VSR into EMR at all NHs	 Champions interpreted compliance as <u>offering</u> (i.e., VSR completion) vs <u>showing</u> video 		

Implementation: FLEXIBILITY (ADHERENCE)

=	ASPECT	Approach	Challenges		
	PRE- SCREENING	HCS: Excluded sites with major organizational or regulatory difficulties	 Determination of 'dysfunctional sites was subjective based on corporate leaders' assessments 		
	SITE WITH- DRAWAL	RT: NHs with low implementation adherence rates were NOT dropped	 HCS divested several NHs mid- implementation 		
	SITE MONITOR- ING	HCS: Internal monthly reports for VSR completion for <u>admissions only</u> RT: <u>Quarterly reports</u> were completed for admissions and LTC; <u>champion interviews</u> uncovered issues (lack of focus on LTC, champion turnover)	 HCS internal reports for admissions only and based on offering videos, so missed low compliance among Long Stay Monitored 'show' rate onl later 	r	

Goal: Disseminating Interventions

- Once FDA approved, Pharmacological treatments promulgated by advertisement
- Pharmacy based treatments are simple; substitute one drug for another OR add new drug; no change in staff routine.
- Non-pharmacologic treatments require BOTH not prescribing AND doing something different
- Passing pills same across NHs; restructuring staff time for other tx may differ across NHs

When is an Intervention Ready for Diffusion in a Health Care System?

- Many non-pharmacologic interventions have been shown to be effective in meeting NH patients' needs
- BUT, generally not replicated
- Rarely replicated under control of Health System
- If Health Systems don't take charge, hard to imagine real diffusion

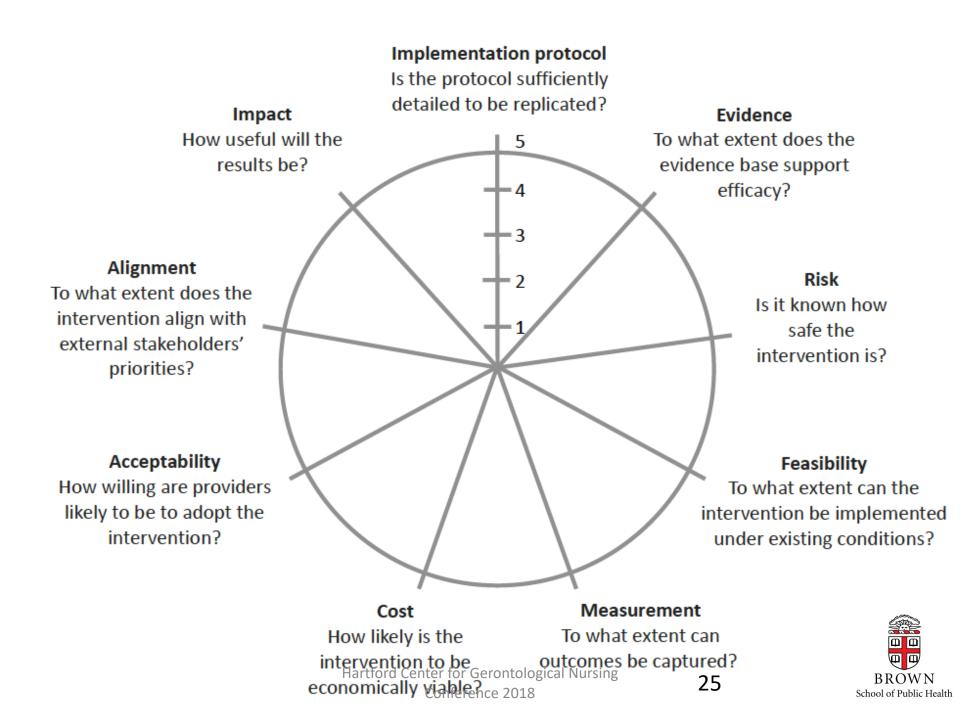

Readiness Assessment for Pragmatic Trials (RAPT)

Table 1
Criteria to Determine Which Dementia Interventions Are Ready for PCTs

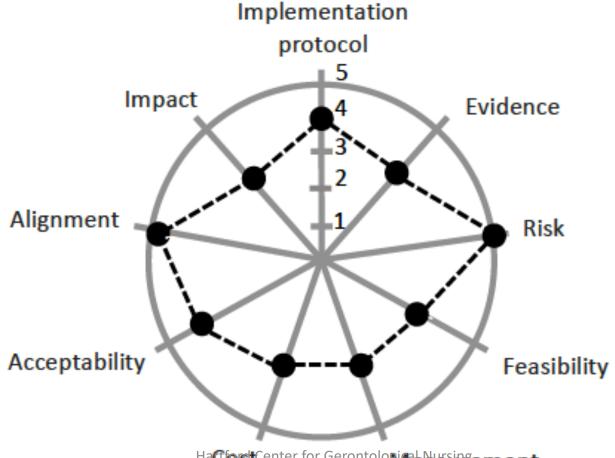

Criterion	Rationale
1. Intervention protocol	The intervention must have a well-articulated protocol in order to be replicated.
2. Evidence	There must be some evidence demonstrating the efficacy that the intervention and/or its components improves the clinical outcomes of interest.
3. Risk	The intervention should be low risk. Adverse events and unintended consequences need to be carefully considered in this vulnerable population.
4. Feasibility	It should be possible to implement the intervention under real-world conditions within health care systems.
5. Measurement	The intervention's impact should be measurable using existing data or with minimal burden by health care partners.
6. Cost	An intervention should be cost-neutral or cost- effective for health care partners and/or incentivized by insurers.
7. Acceptability	Health care partners should believe that the potential impact of the intervention is important and that it can be adopted.
8. Alignment	The intervention should address priorities for health care partners and other stakeholders.
9. Impact	The intervention's outcomes should inform clinical decision making and policy.

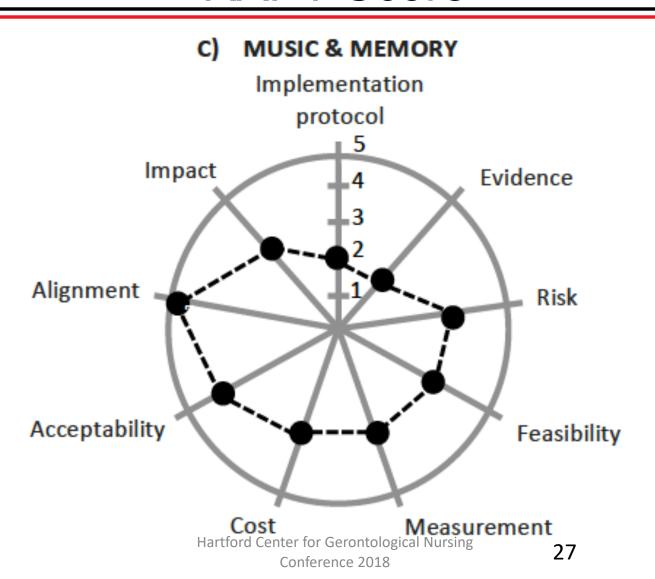

PROVEN: Video Assisted Advance Care Planning RAPT scoring

B) Advance Care Planning Specialist Program

Music & Memory: RAPT Score

What is Music & Memory?

- Music & Memory is a personalized music program
- Description: Staff identify music a nursing home resident with dementia preferred when s/he was a young adult and load music on a personal music device (MP3 player)
- Popularity: Thousands of nursing homes in the US have become certified in the program, several state initiatives, subject of a powerful documentary "Alive Inside"
- Potential benefits: non-pharmaceutical alternative to managing agitated behaviors; improve sleep / alertness; decrease resistance to staff assistance with dressing or bathing; appetite stimulation; improve quality of life
- Limitation: Rigorous evaluation is necessary to establish efficacy and to characterize factors associated with effective implementation

School of Public Health

Music & Memory Pilot (R21)

- 4 nursing homes, 1 per partnering corporation
- 47 residents with moderate or severe dementia received the Music & Memory program during the 6-month pilot (January, 2018 – June, 2018)
- 34 of the 47 residents had data available pre-music and post-music
- Measured agitated behaviors by:
 - Directly observing residents when using and not using music (Agitated Behaviors Mapping Instrument),
 - Interviewing staff members about resident behaviors (Cohen-Mansfield Agitation Inventory), and
 - Using available administrative data (MDS 3.0, Section E)

Music & Memory Pilot (R21)

Unpublished Pilot Data: *Within-Person* Changes in Agitated Behaviors Before and After Using Music & Memory, Based on Staff Interviews using the Cohen-Mansfield Agitation Inventory*

	Before Music & Memory	After Music & Memory	Within Person Change s	Wilcoxon signed rank test
	Mean (SD)	Mean (SD)	Mean (SD)	p-value
Total Score	61.24(16.32)	51.24(16.05)	-10.00(18.94)	0.002
Physically aggressive behaviors	18.03(7.16)	15.03(5.78)	-3.00(5.98)	0.013
Physically nonaggressive behaviors	15.85(6.51)	13.38(6.84)	-2.47(5.07)	0.002
Verbally agitated behaviors	13.74(6.20)	11.03(6.02)	-2.71(7.47)	0.033
Hiding and hording behaviors	2.65(1.23)	2.44(1.69)	-0.21(1.93)	0.303

^{*}Includes 34 of the 47 residents with moderate to severe dementia who received Music & Memory during the pilot and had staff interviews before and after receiving the Music & Memory program. Higher scores interviews before and after receiving the Music & Memory program. Higher scores interviews before and after receiving the Music & Memory program. Higher scores interviews before and after receiving the Music & Memory during the pilot and had staff in the pilot and had staff

Summary

- Not enough for researchers to test Nonpharmacologic behavioral interventions for persons with ADRD
- To be used, health systems must be willing to substitute these for drug treatment
- Requires evidence of feasibility AND effectiveness in fully functioning HCS
- Researchers must partner with HCS to implement the most salient features of researchers' interventions
