

# Predicting Follow-up Colonoscopy to an Abnormal Fecal Test in Safety-Net Clinics

Amanda Petrik,  
Sr. Research Associate

The Center for Health Research

# Research Team

*The Center for Health Research, Kaiser Permanente Northwest, Portland, Oregon*

- Gloria Coronado, PhD, Principal Investigator
- Eric Johnson, PhD, Investigator
- David Smith, PhD, RPh, Investigator
- Erin Keast, MS, Analyst

# Background

- Colorectal cancer (CRC) is the 2nd leading cancer killer in the US
- The Strategies and Opportunities to STOP Colon Cancer in Priority Populations (STOP CRC) project conducted a mailed fecal testing program.
  - Mailed Introductory Letter/FIT/Reminders
- Noticed gaps in achieving a follow-up colonoscopy after an abnormal FIT test
  - 89% receiving referrals
  - 59% completing colonoscopy (in FQHC's)
- Interventions like patient navigation can improve follow-up rates, although it can be expensive

# Background:

## Barriers to colonoscopy:

### Patient-level

- fear of results
- inability to take time off of work
- inability to purchase preparation materials or complete adequate bowel prep
- difficulty finding a driver on the day of the procedure

### System-level

- limited colonoscopy capacity
  - failure to refer the patient or schedule the procedure
  - failure to communicate expectations about the procedure or prep
- Knew we needed to ***identify patients most in need of patient navigation***:
    - aimed to develop a prediction model using patient level data available in the EHR to identify patients unlikely to undergo colonoscopy following an abnormal test.

# Precision Medicine

# FIT can identify high-risk patients

## Screening colonoscopy (refer 1,000 patients)

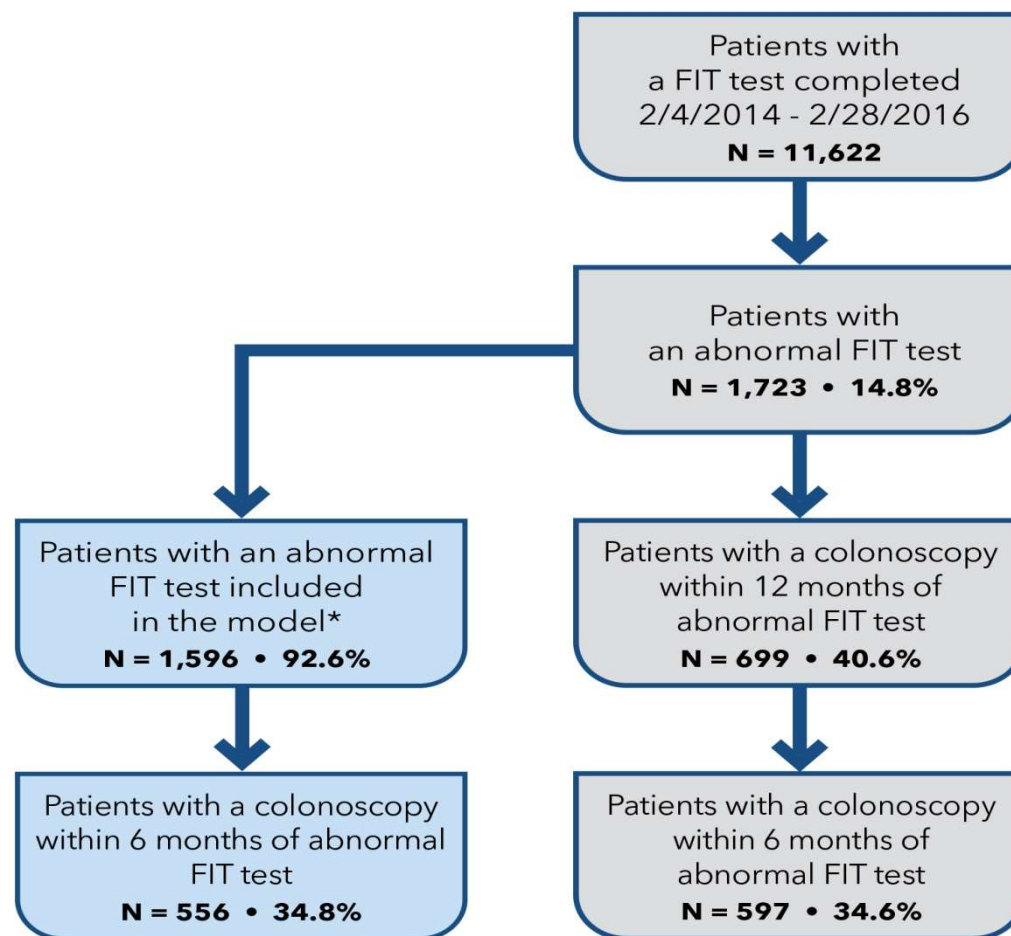

● Represents 20 patients

## FIT testing (2,000 patients)

# Population:

*\*Patients excluded from clinics too small to contribute and with missing data.*

# Predictors of Colonoscopy

<b>Age</b>	<b>Emergency Room Visits per 1,000 Medicare Enrollees (County)</b>
<b>Sex</b>	<b>Urban/Rural County</b>
<b>BMI</b>	<b>Charlson Comorbidity</b>
<b>Language (English/Non-English)</b>	<b>Asthma/COPD dx in 2 years prior to index</b>
<b>Race (White/Non-White)</b>	<b>Diabetes dx in 2 years prior to index</b>
<b>Ethnicity (Hispanic/Non-Hispanic)</b>	<b>Severe mental illness</b>
<b>Insurance</b>	<b>Mood disorder (Depression, Bipolar) dx in 2 years prior to index</b>
<b>Tobacco Use</b>	<b>Substance/alcohol abuse dx in 2 years prior to index</b>
<b>Percent of Census Tract with College Degree</b>	<b>Long term anticoagulant use</b>
<b>Percent of Census Tract Households below FPL</b>	<b>Blood in Stool prior to positive FIT</b>
<b>Census Tract Median Household Income</b>	<b>Hemorrhoid/Anal Fissure prior to positive FIT</b>
<b>Census Tract Unemployment</b>	<b>Prior CRC screening</b>
<b>Census Tract Population Density (People per square mile of land area)</b>	<b>Flu shot within 1 year of index date</b>
<b>Census Tract GINI Income Inequality</b>	<b>Number of outpatient encounters in year prior to index date</b>
<b>Low access Census Tract at 1/2 mile for urban areas or 5 miles for rural areas</b>	<b>Count of no-show encounters in year prior to index date</b>
	<b>Health Center</b>

Not significant characteristics include gender, BMI, language, ethnicity, tobacco use, % of census tract with college degree, percent of census tract households below FPL, census tract median household income, census tract unemployment, census tract population density, census tract low access, ER visits per 1,000, urban/rural, Charlson comorbidity, asthma/COPD, diabetes, severe mental illness, mood disorder, substance/alcohol abuse, blood in stool, hemorrhoid/anal fissure, prior CRC screening, number of outpatient encounters.

# Performance statistics

<b>C-statistic (95% CI)</b>	<b>0.6598</b>
<b>R<sup>2</sup> (95% CI)</b>	<b>13.08 (9.36-17.13)</b>
<b>D (95% CI)</b>	<b>0.794 (0.658-0.931)</b>
<b>Bootstrap-corrected c-statistic</b>	<b>0.6328</b>
<b>Slope Shrinkage</b>	<b>0.0997</b>
<b>A D-statistic of zero means that the model failed to separate higher and lower risk patients. The R<sup>2</sup> statistic measures the amount of variation explained in the model.</b>	

# Histogram of Predicted Probability

# Assigning risk score points to patients, translating the tool into practice:

## Hypothetical patient:

70 years old	0 points
Commercial Insurance	0 points
Non-white	0 points
Anti-Coagulants	0 points
No Flu-Shot (in past year)	0 Points
2+ No Show Appts	0 Points
Care at Health Center 8	0 Points

**Total probability                      0 points**

**Bottom quintile=  
<18% chance of completing colonoscopy**
